

# TANK FARMS

**Strad** is committed to helping develop North America's resources responsibly and safely. To do this, Strad has continually worked to provide customers with **superior solutions and services** in the energy industry.

Strad is a leading supplier of tank farms in the North American oil and gas industry. Tanks Farms, also known as invert systems or mud storage systems, are comprised of a grouping of key equipment to properly contain fluids and drilling waste on site. Strad's standard tank farm consists of four to eight - 400 BBL (63m<sup>3</sup>) upright tanks that are situated together in close proximity for the temporary storage of drilling fluids on a well site.

Strad's tank farms can be utilized during the completions cycle as temporary storage for fresh water or frac water flow-back. We also provide insulated 400BBL tanks which help regulate fluid temperature for use during the fracing process.

The tanks are set up within a spill containment system (SuperBerm®) which sits on top of a rig mat pad to prevent fluids or waste from coming in direct contact with the ground. Strad's SuperBerm® is the only engineered berm in the oil and gas market that is qualified to hold 110% of fluid volume. Other equipment include: liners, mats, tanks, pumps, fire extinguishers, stairs and road crossings.

Additional rental equipment is available to customize tank farm systems for customers. All products and equipment exceed provincial, federal and safety regulations. Strad provides all tank farm equipment with proper signage and lighting.

## Tank Farm Options

- Spill containment system (SuperBerm®)
- Road crossings
- Stair signage, lights and trays
- Fire extinguishers
- Transfer pumps (electric/diesel power)
- Hose manifolds
- Rig matting
- Strad will provide tank farm set up on any number of tanks to suit your project requirements

## Advantages

Our full service solution team is highly trained and experienced at mobilizing and demobilizing tank farms and can handle all logistics for the transportation of fluids and equipment.

Strad works with customers to find the **right equipment and design tank farm configurations** to meet each sites needs. With in-house manufacturing, we are able to customize tanks and berms for specific needs.
